

Wild Dog Conservation in East and Southern Africa

Africa's wild athletes. But they are threatened and need our help. To conserve them we need to work at large scale and across national boundaries

This unique carnivore lives in packs, and cannot only breed if the size of the pack is large enough. There are estimated to be less than 1000 packs of wild dog left in the region. Habitat loss, decrease in the animals they eat, and disease are the main threats to their survival.

Shoulder height: 65 cm
Mass: 24-30 Kg

MAP: Wild Dog distribution if more fragmented than cheetah and we need to work to improve linkages between the existing populations.
